Charles, I have one more question regarding the 2 factor mixed model. The analysis of the 2 factor random and mixed models gives the same F statistic values for the factors, and therefore the sample p-value and conclusion.

To determine if there is a significant difference between two means with equal sample sizes, the Newman-Keuls method uses a formula that is identical to the one used in Tukey's range test, which calculates the q value by taking the difference between two sample means and dividing it by the standard error:

Intervallo di confidenza - goo Wikipedia (italiano)

In statistica, quando si stima un parametro, la semplice individuazione di un singolo valore è spesso non sufficiente. È opportuno allora accompagnare la stima di un parametro con un intervallo di valori plausibili per quel parametro, che viene definito intervallo di confidenza (o intervallo di fiducia).
